Instructions for use: NeuroStat Baseline

NeuroStat Baseline

Read all of this document carefully before you start. Keep it: you may need to read it again. If you have further questions, ask your doctor, pharmacist or occupational health service.

1. What NeuroStat Baseline is

NeuroStat Baseline is software for cognitive assessment. It is intended for: fitness-for-work screening in extreme environments, including offshore, polar and defence settings.

How it works

Baseline is a set of short computerised tasks covering sustained attention, working memory, executive function and risk-based decision making. A person completes it before deployment and again at set intervals. Changes from their own baseline, not from a population average, are reported to the responsible physician.

2. Before you use it

- Baseline supports clinical judgement and does not replace it. Results are interpreted by a qualified physician.
- Performance can be affected by sleep loss, illness, medication and the testing environment. Record these when interpreting a result.
- Baseline is not a diagnostic test for any condition.

3. Reporting problems

If you notice any side effect or problem, talk to your doctor, pharmacist or occupational health service. You can also report it to your national authority and to NeuroStat at safety@neurostat.example. Reporting helps provide more information on the safety of this product.
