BOREAS-2 Protocol Synopsis, v1.2

Doc. NS-CA-BS2-SYN-v1.2 · 30 August 2028

Classification: Study confidential

NEUROSTAT STUDY CONFIDENTIAL

Study title

A Phase II, randomised, double-blind, placebo-controlled study of the safety, tolerability and efficacy of NS-760 in maintaining cognitive performance in adults working extended winter rotations on offshore installations at high latitude.

Item	Summary
Study ID	BOREAS-2
Sponsor	NeuroStat Holding AG
Phase	II
Population	Adults 18 to 65 years working an extended winter rotation at a participating installation
Design	Randomised 1:1, double-blind, placebo-controlled, parallel group
Duration	Treatment for the length of the winter rotation (about 20 weeks), with follow-up two weeks after the end of treatment
Primary endpoint	Change from baseline in composite cognitive performance (attention, working memory, executive function) at week 12
Secondary endpoints	Sleep (actigraphy and diary), mood, safety and tolerability, pharmacokinetics (sparse sampling)
Local investigator	Installation medic (Dr. N. Fossum)

Key eligibility

- Inclusion: age 18 to 65; working a winter rotation at the study site; able to give written informed consent.
- Exclusion: epilepsy or seizure history; severe liver or kidney disease; regular use of prescription stimulants or sedatives; known hypersensitivity to racetam medicines; expected departure before the end of the rotation.

Procedures

Participants attend the medical room weekly for dispensing and a short check, and complete cognitive testing with NeuroStat Baseline at fixed intervals. Study medication and placebo are identical in appearance. Treatment allocation is not known to the participant, the investigator or the crew.
